Ashish Chauhan

Technical Product Manager — Fraud, Risk & RegTech Platforms

Ahmedabad, India | ashishchauhan28802@gmail.com | 8000001378 | ashishchauhan.site | LinkedIn | GitHub

SUMMARY

Technical Product Manager background grown out of 3 years as a Tech Lead shipping backend platforms for the banking sector, combined with a Minor in Design. Repeatedly identified product-level bottlenecks and drove the decisions to fix them at the platform level: recognized a dev-release-cycle bottleneck in a fraud/AML platform and drove the decision to rebuild rule configuration as a self-serve, no-code/low-code builder; recognized a shared data-integration need across two separate products and defined it as its own shared platform (UDIP); designed RBAC as a deliberate, reusable platform capability rather than a one-off feature. Led a 10-engineer team delivering a ~Rs. 25 crore, government-sponsored, multi-year contract across 4,500+ bank branches.

EXPERIENCE

SSB Digital Pvt Ltd, Ahmedabad Feb 2024 - Present

Tech Lead, Product-Facing Ownership (May 2025-Present) | Software Developer (Feb 2024-Apr 2025)

- Owned product direction and backend delivery for a ~Rs. 25 crore, 3-year government-sponsored fraud/AML platform spanning 4,500+ branches across 9 Regional Rural Banks (RRBs) — two flagship products, each priced per-branch under a single multi-year contract.
- Identified that fraud-rule changes required a full engineering release cycle, creating a product bottleneck for bank operations teams; drove the decision to rebuild rule and workflow configuration as a self-serve, no-code/low-code builder — removing engineering from the critical path for day-to-day rule changes.
- Drove outcomes directly tied to the product's core value proposition: ~500 fraudulent accounts flagged, 40% reduction in alert latency, achieved by defining and prioritizing iterative tuning of the rules/threshold engine with the bank as a stakeholder.
- Recognized a shared data-integration need duplicated across both flagship products and defined it as its own platform capability (UDIP — a high-throughput, offline-first ingestion platform for air-gapped bank environments), rather than letting each product solve it independently.
- Treated Role-Based Access Control as a deliberate, reusable platform capability — designed once, reused across both flagship products and later repurposed for an unrelated AI knowledge-management engagement, validating the platform-thinking approach.
- Scoped and delivered an AI/ML-based risk-scoring layer as a product differentiator on top of the existing rules engine, moving the product from static rules toward model-driven risk prediction.
- Managed stakeholder relationships directly with bank clients and a government sponsor across a multi-year, month-to-month contract structure.

ConceptServe Technology, Ahmedabad — Software Developer May 2023 - Dec 2023

- Delivered product enhancements for an airport parking-management system and a temple VIP-visitor-management system, working directly with on-site operational stakeholders to translate real-world friction (incident alerting, VIP throughput) into shipped features.

PRODUCT & LEADERSHIP SKILLS

Product discovery from engineering context, no-code/self-serve platform design, platform/reusability thinking, stakeholder management (bank clients + government sponsor), roadmap prioritization under a live multi-year contract, cross-functional leadership of a 10-engineer team.

TECHNICAL FLUENCY

Java, Spring Boot, Microservices, MySQL/PostgreSQL/Oracle, Redis, Docker, applied ML for risk scoring — enables direct, credible collaboration with engineering teams without translation loss.

EDUCATION

B.Tech, Computer Science & Engineering, Minor in Design — Ahmedabad University, Aug 2020-May 2024

ADDITIONAL

Cinematographer/video editor — 2nd prize for a documentary at Nirma University on Ahmedabad's culture and architecture (design/storytelling sensibility applied to product narrative). Languages: English, Hindi, Gujarati.
