Ashish Chauhan

Tech Lead — Backend & Platform Engineering, Fraud, Risk & RegTech Systems

Open to relocation / visa sponsorship | ashishchauhan28802@gmail.com | ashishchauhan.site | LinkedIn | GitHub

SUMMARY

Tech Lead with **3 years** of experience architecting and delivering large-scale backend platforms for the banking sector. Led a **10-engineer team** on a approximately $1.8M USD, 3-year government-sponsored fraud/AML platform deployed across 4,500+ branches of a government-backed rural banking network, flagging approximately 500 fraudulent accounts and cutting alert latency by 40% through an ML-augmented rules engine. Built a complete **RBAC system** and a **no-code/low-code rule-and-workflow builder** from scratch, letting operations teams self-configure logic without engineering releases. Open to relocation and visa sponsorship for backend/platform leadership roles in fraud, risk, and regulatory-technology products.

EXPERIENCE

SSB Digital Pvt Ltd

Feb 2024 - Present

Tech Lead (May 2025-Present) | Software Developer (Feb 2024-Apr 2025)

Stack: Java, Spring Boot, Spring Security, MySQL, PostgreSQL, Oracle, Redis, WebSockets, Spring Batch, Docker, Microservices

Flagship contract: **approximately $1.8M USD**, 3-year government-sponsored fraud/AML platform across **4,500+ branches** of a government-backed rural banking network — two products (EWS, FAME) plus the shared UDIP ingestion backbone, priced per-branch, month-to-month. Both EWS and FAME delivered and deployed to production in **approximately 3 months each**, with fast UAT turnaround.

EWS — Fraud Early-Warning System

- Built a real-time rules and threshold engine; flagged **approximately 500 fraudulent/suspicious accounts** and cut alert latency by **40%** through iterative production tuning.
- Designed and built an **AI/ML-based risk-scoring layer** augmenting the static rules engine with model-driven fraud risk prediction.
- Integrated with core banking systems via an ETL pipeline (Spring Batch) to ingest daily transactions and generate compliance alerts in real time (Redis caching + WebSockets), coordinated with national cybercrime/financial-intelligence reporting requirements.
- Optimized EWS for concurrent users with Redis caching and database query tuning, cutting heavy query response times from **approximately 8-9 seconds to milliseconds (approximately 85% faster)** under concurrent load at larger banks.

FAME — Money-Mule Detection & Regulatory Reporting

- Built the **money-mule detection module** and consolidated additional telecom-based and financial-risk-indicator regulatory reporting feeds into the same FAME platform.
- Built a **no-code/low-code rule-and-workflow builder**, letting operations teams self-configure business logic without a dev release cycle.
- Designed and built a complete **Role-Based Access Control (RBAC) system** from scratch, reused across both flagship products and later repurposed for an unrelated AI knowledge-management engagement.

UDIP — Data Ingestion Platform

- Designed and led a **high-throughput, offline-first data ingestion platform** handling **5-6GB text files / millions of records per day** for air-gapped deployments — the shared ingestion backbone feeding both flagship products.

ECL — Credit-Risk Suite

- Designed and built a credit-risk suite end-to-end (PD/LGD/EAD-based **Expected Credit Loss** calculator with capital-adequacy attribution and credit-guarantee-scheme tracking), validated against the solution design doc's worked example.

Other Platforms

- Designed full backend architecture solo for a litigation-tracking system: hierarchical departments, dynamic role management, and real-time WebSocket notifications.
- Built an asset-tracking and post-loan-monitoring system: Spring Batch loading into an H2 cache layer, REST APIs, and automated delinquency-status reporting.

ConceptServe Technology — Software Developer

May 2023 - Dec 2023

Stack: Spring Boot, Java, MySQL, JWT, Microservices

- Enhanced an airport parking-management system: REST APIs, automated incident alerting, and automated SMS — **improving alert response time by 20%** and increasing user satisfaction.
- Built a VIP visitor-management system for a large public venue: RFID-based enrollment/verification with a live dashboard.
- Built a secure, scalable microservices-based intelligent traffic-control system with JWT + OTP-verified access.

SKILLS

Backend: Java, Spring Boot, Spring Security, JDBC, Hibernate, Microservices, Distributed Systems, gRPC, WebSocket, Docker/Docker Compose
Data: MySQL, PostgreSQL, Oracle, MongoDB, NoSQL, Redis
AI/ML: Python, ML-based classification and risk-scoring models, applied ML for fraud detection
Domain: Fraud/AML detection, regulatory-tech compliance, RBAC design, credit-risk (ECL/CRAR) modeling
Leadership: 10-engineer team leadership, multi-year contract delivery at national scale, architecture ownership
Tools: Git, GitHub, Bitbucket, VS Code, Eclipse, Docker, Photoshop, Premiere Pro, After Effects

EDUCATION

B.Tech, Computer Science & Engineering, Minor in Design — Ahmedabad University, Aug 2020-May 2024

ADDITIONAL

Cinematographer/video editor — 2nd prize for a university documentary on urban culture and architecture. Languages: English, Hindi, Gujarati. Targeting UAE, Singapore & other strong RegTech markets, or fully remote.
