PLATFORM OUTCOMES

₹25Cr
MULTI-YEAR CONTRACT OWNED

4,500+
BRANCHES, 9 RRBS

500+
FRAUD ACCOUNTS FLAGGED

40%
ALERT-LATENCY REDUCTION

PRODUCT SKILLS

Product Discovery · No-Code Design · Platform Thinking · Stakeholder Mgmt · Roadmap Prioritization · Cross-Fn Leadership

TECHNICAL FLUENCY

Java · Spring Boot · Microservices · MySQL/Postgres · Redis · Docker · Applied ML

EDUCATION

B.Tech, CSE + Minor in Design
Ahmedabad University
Aug 2020–May 2024

ADDITIONAL

Cinematographer/video editor — 2nd prize, Nirma University documentary on Ahmedabad's culture & architecture.

English · Hindi · Gujarati

ASHISH CHAUHAN

Technical Product Manager — Fraud, Risk & RegTech Platforms

SUMMARY

Technical Product Manager background grown out of 3 years as a Tech Lead shipping backend platforms for the banking sector, combined with a Minor in Design. Repeatedly identified product-level bottlenecks and drove the decisions to fix them at the platform level: recognized a dev-release-cycle bottleneck in a fraud/AML platform and drove the decision to rebuild rule configuration as a self-serve, no-code/low-code builder; recognized a shared data-integration need across two separate products and defined it as its own shared platform (UDIP); designed RBAC as a deliberate, reusable platform capability rather than a one-off feature.

EXPERIENCE

SSB Digital Pvt Ltd, Ahmedabad
2024–Present

Tech Lead, Product-Facing Ownership (May 2025–Present) · Software Developer (Feb 2024–Apr 2025)

- Owned product direction and backend delivery for a ~₹25 crore, 3-year government-sponsored fraud/AML platform spanning 4,500+ branches across 9 Regional Rural Banks — two flagship products, each priced per-branch under a single multi-year contract.
- Identified that fraud-rule changes required a full engineering release cycle, creating a product bottleneck for bank operations teams; drove the decision to rebuild rule and workflow configuration as a self-serve, no-code/low-code builder — removing engineering from the critical path for day-to-day rule changes.
- Drove outcomes directly tied to the product's core value proposition: ~500 fraudulent accounts flagged, 40% reduction in alert latency, achieved by defining and prioritizing iterative tuning of the rules/threshold engine with the bank as a stakeholder.
- Recognized a shared data-integration need duplicated across both flagship products and defined it as its own platform capability (UDIP — a high-throughput, offline-first ingestion platform for air-gapped bank environments), rather than letting each product solve it independently.
- Treated Role-Based Access Control as a deliberate, reusable platform capability — designed once, reused across both flagship products and later repurposed for an unrelated AI knowledge-management engagement, validating the platform-thinking approach.
- Scoped and delivered an AI/ML-based risk-scoring layer as a product differentiator on top of the existing rules engine, moving the product from static rules toward model-driven risk prediction.
- Scoped and delivered a credit-risk product (Expected Credit Loss calculator with audit trail, capital-adequacy attribution, credit-guarantee tracking) end-to-end, validated against the solution design doc's worked example to within ₹2 — shipped as a real, working capability rather than a shelved demo.
- Managed stakeholder relationships directly with bank clients and a government sponsor across a multi-year, month-to-month contract structure.

ConceptServe Technology, Ahmedabad
2023

Software Developer · May 2023–Dec 2023

- Delivered product enhancements for an airport parking-management system and a temple VIP-visitor-management system, working directly with on-site operational stakeholders to translate real-world friction (incident alerting, VIP throughput) into shipped features.
