Ashish Chauhan

Tech Lead — Backend & Platform Engineering · Fraud, Risk & RegTech Systems

Open to relocation / visa sponsorship
ashishchauhan28802@gmail.com
ashishchauhan.site · LinkedIn · GitHub

SUMMARY

Tech Lead with 3 years of experience architecting and delivering large-scale backend platforms for the banking sector. Led a 10-engineer team on a ~$1.8M USD, 3-year government-sponsored fraud/AML platform deployed across 4,500+ branches of a government-backed rural banking network, flagging ~500 fraudulent accounts and cutting alert latency by 40% through an ML-augmented rules engine. Built a complete RBAC system and a no-code/low-code rule-and-workflow builder from scratch, letting operations teams self-configure logic without engineering releases. Open to relocation and visa sponsorship for backend/platform leadership roles in fraud, risk, and regulatory-technology products.

EXPERIENCE

SSB Digital Pvt Ltd

Tech Lead (May 2025–Present) · Software Developer (Feb 2024–Apr 2025)

Java, Spring Boot, Spring Security, MySQL, PostgreSQL, Oracle, Redis, WebSockets, Spring Batch, Docker, Microservices

- Led backend architecture and delivery for a ~$1.8M USD, 3-year government-sponsored fraud/AML platform deployed across 4,500+ branches of a government-backed rural banking network; priced per-branch, month-to-month, across two flagship products.
- Flagged ~500 fraudulent/suspicious accounts and cut alert latency by 40% through iterative tuning of a real-time rules and threshold engine in production.
- Designed and built an AI/ML-based risk-scoring layer augmenting the static rules engine with model-driven fraud risk prediction.
- Designed and built a complete Role-Based Access Control (RBAC) system from scratch, used across both flagship products.
- Built a no-code/low-code rule-and-workflow builder, letting operations teams self-configure business logic without requiring a dev release cycle.
- Integrated with core banking systems via an ETL pipeline (Spring Batch) to ingest daily transactions and generate compliance alerts in real time (Redis caching + WebSockets), coordinated with national cybercrime/financial-intelligence reporting requirements.
- Designed and led a high-throughput, offline-first data ingestion platform handling 5–6GB text files / millions of records per day for air-gapped deployments — the shared ingestion backbone feeding both flagship products.
- Designed and built a credit-risk suite end-to-end (PD/LGD/EAD-based Expected Credit Loss calculator with audit logging, capital-adequacy attribution, credit-guarantee-scheme tracking, maker-checker commission controls), validated to within $0.02 (₹2) of the solution design doc's worked example.
- Architected the platform for reusability — the same RBAC/workflow/document-generation infrastructure was successfully repurposed for an unrelated AI knowledge-management engagement.
- Designed full backend architecture solo for a litigation-tracking system: hierarchical department structure, dynamic branch/role management, super-admin-controlled permissions, real-time WebSocket notifications.
- Built an asset-tracking and post-loan-monitoring system: Spring Batch loading of large datasets into an H2 cache layer, REST APIs, dynamic report generation, and scheduled automation for delinquency/asset status tracking.

ConceptServe Technology — Software Developer

May 2023–Dec 2023

Spring Boot, Java, MySQL, JWT, Microservices

- Enhanced an airport parking-management system: REST APIs, automated incident alerting, dynamic reporting, automated SMS, and resolved recurring database connection issues.
- Built a VIP visitor-management system for a large public venue: RFID-based enrollment/verification with a live dashboard.
- Built a secure, scalable microservices-based intelligent traffic-control system with JWT + OTP-verified access.

SKILLS

Backend: Java, Spring Boot, Spring Security, JDBC, Hibernate, Microservices, Distributed Systems, gRPC, WebSocket, Docker/Docker Compose

Data: MySQL, PostgreSQL, Oracle, MongoDB, NoSQL, Redis

AI/ML: Python, ML-based classification & risk-scoring models, applied ML for fraud detection

Domain: Fraud/AML detection, regulatory-tech compliance, RBAC design, credit-risk (ECL/CRAR) modeling

Leadership: 10-engineer team leadership, multi-year contract delivery at national scale, architecture ownership

Tools: Git, GitHub, Bitbucket, VS Code, Eclipse, Docker, Photoshop, Premiere Pro, After Effects

EDUCATION

B.Tech, Computer Science & Engineering, Minor in Design — Ahmedabad University, Aug 2020–May 2024

ADDITIONAL

Cinematographer/video editor — 2nd prize for a university documentary on urban culture and architecture.
Languages: English, Hindi, Gujarati.

Open to relocation (targeting UAE, Singapore, and other strong regulatory-tech hiring markets) or fully remote roles.
